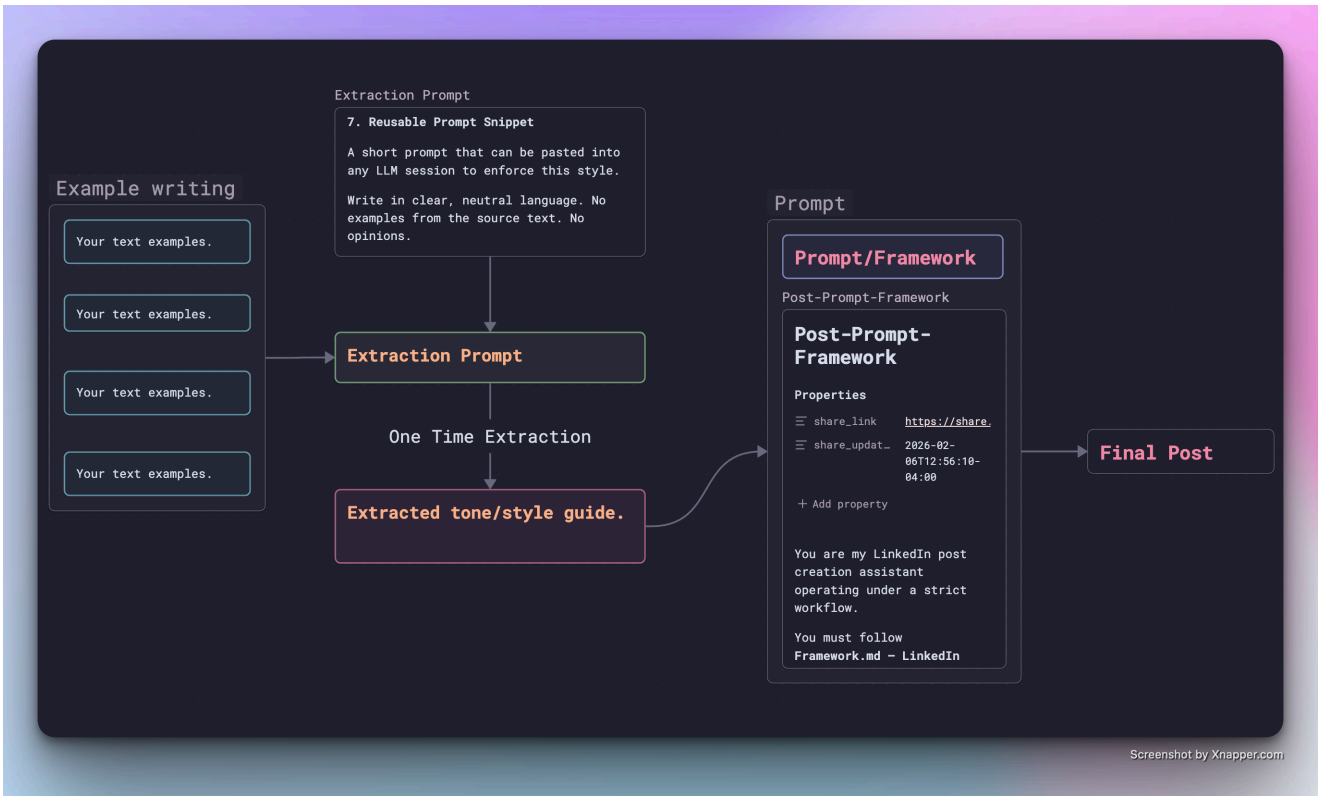
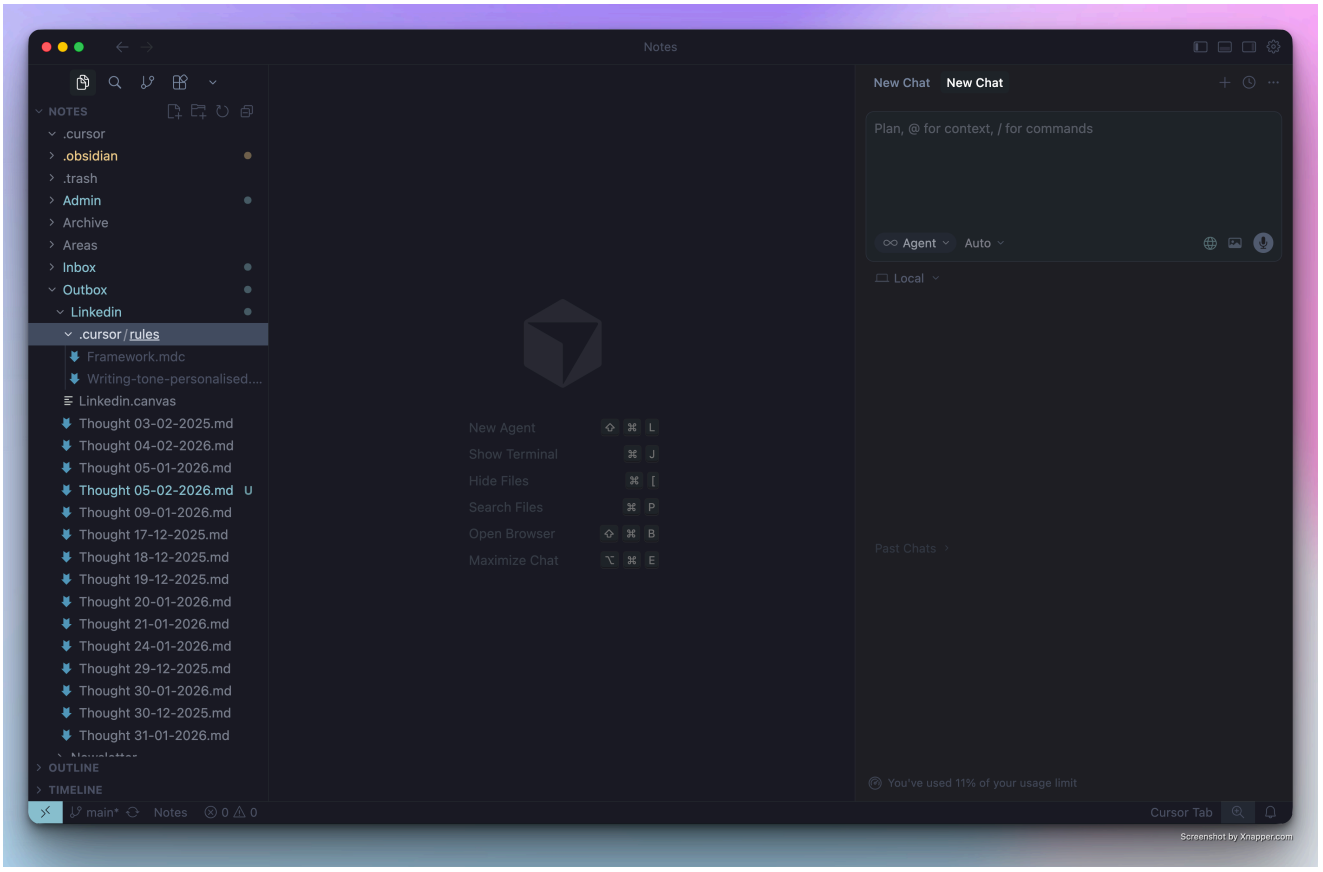
  - That's it.
    - And follow the steps.
    - Just keep answering the questions ..
  - Conclusion
    - Pros
    - Cons

Post creation Workflow via cursor.

Flowchart



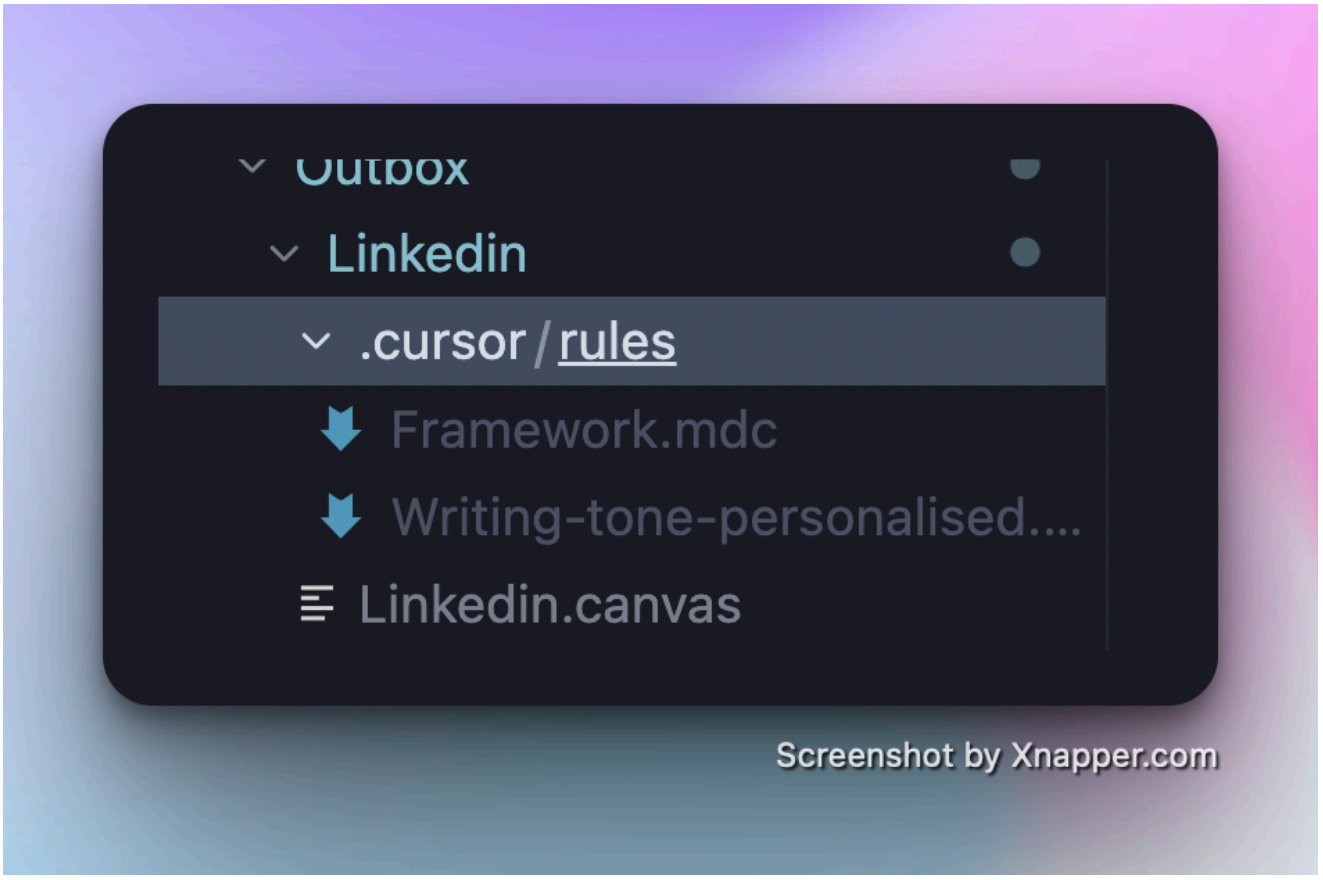
Open your folder (Notes) in cursor



In your notes folder create `.cursor/rules` folder.

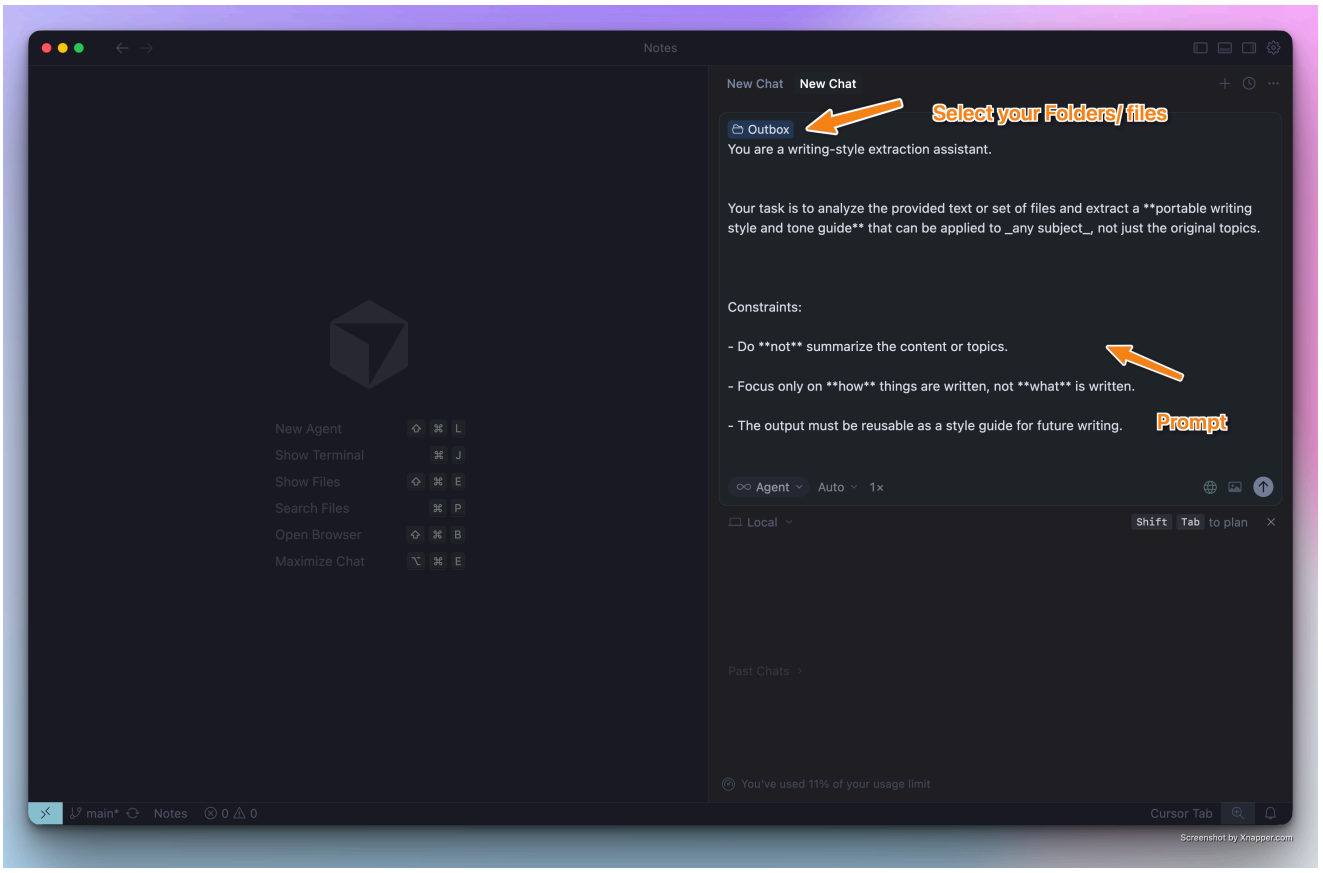
Inside that create two .mdc files.

- Framework.mdc
- write-tone-personalised.mdc



To extract a writing style from your written text. (optional step)

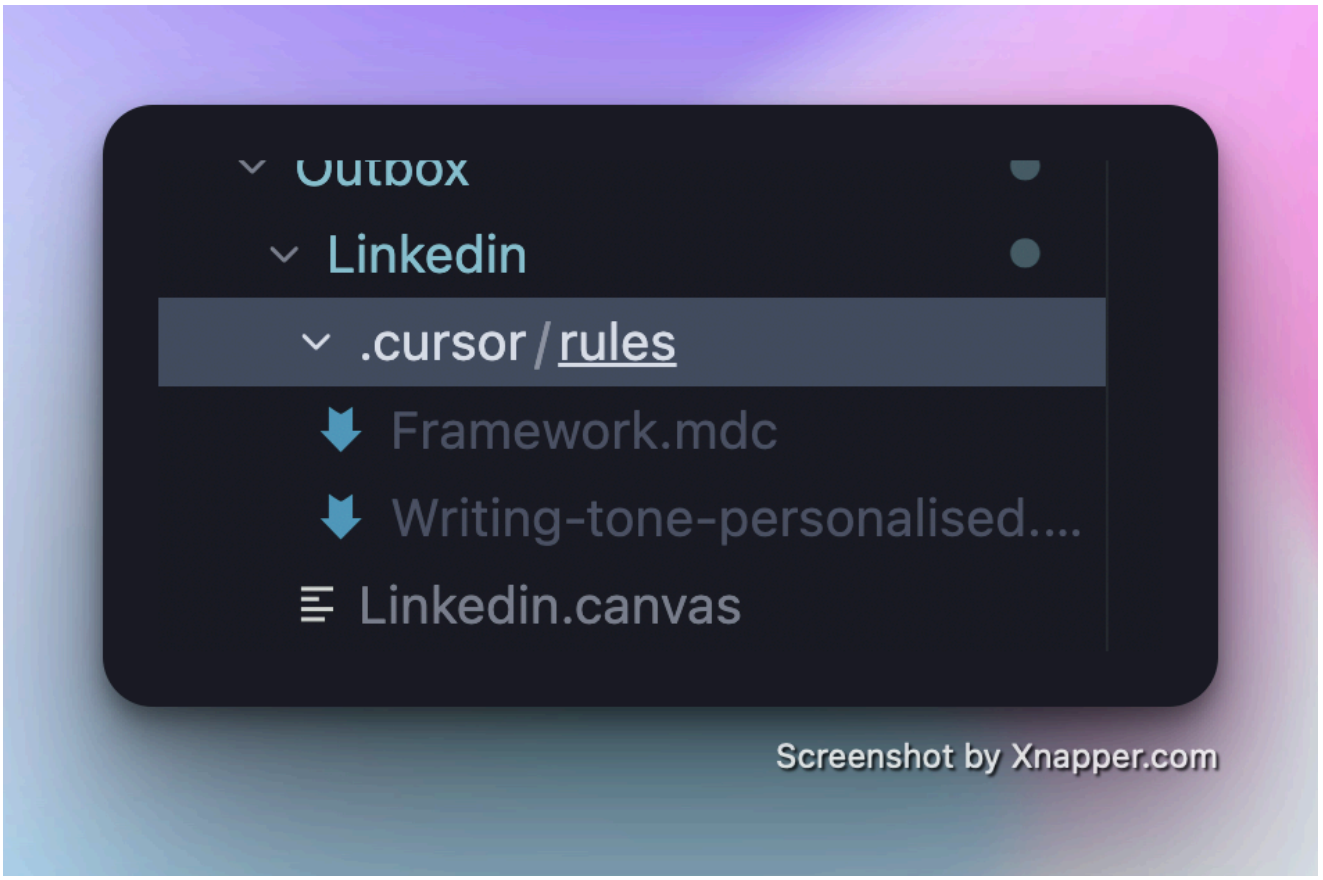
Extraction Prompt



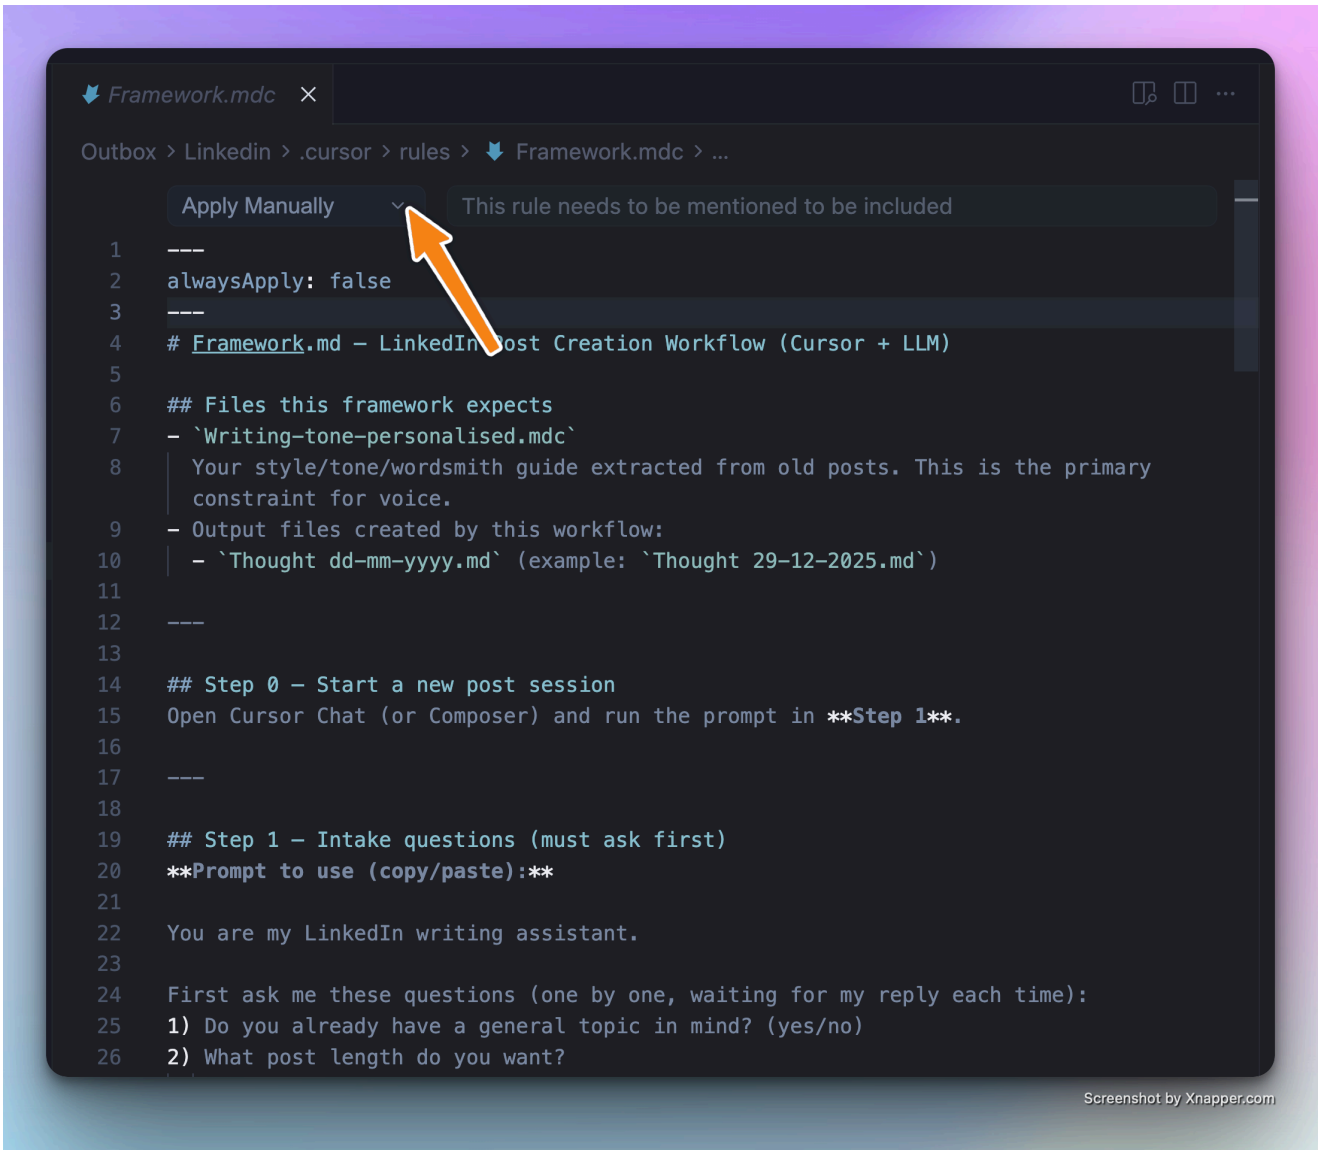
- Save the output to `write-tone-personalised.mdc` file.
- Set the top drop down to "**Apply Manually**" and paste the whole prompt.

Save Framework prompt.

Link

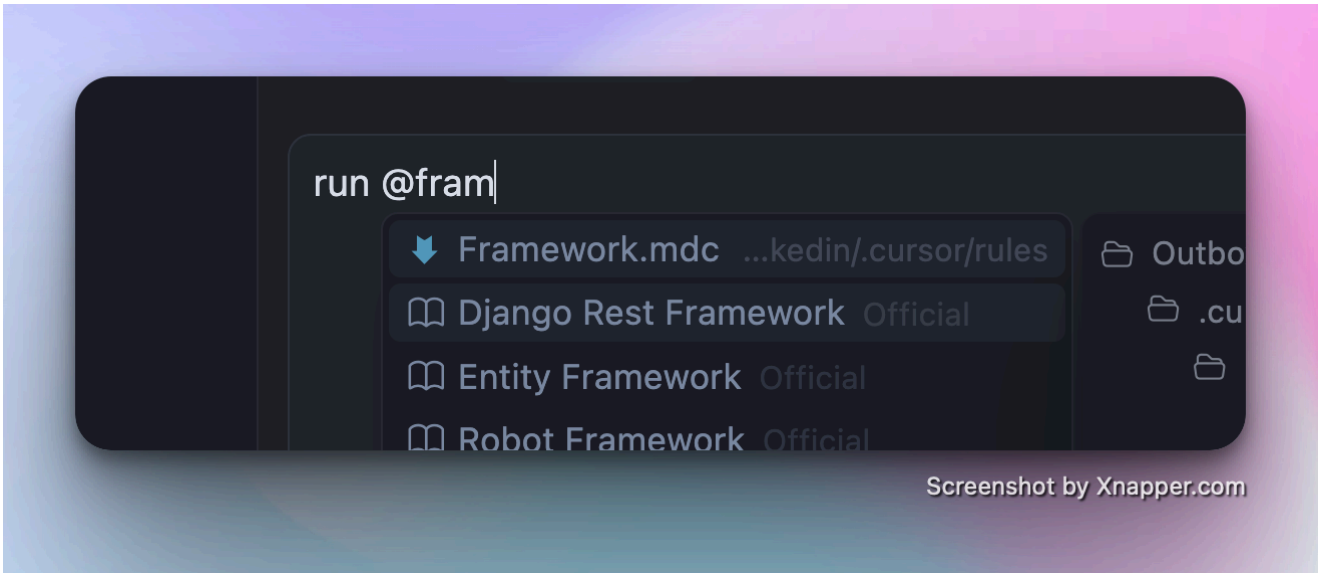


Set the top drop down to "**Apply Manually**" and paste the whole prompt.

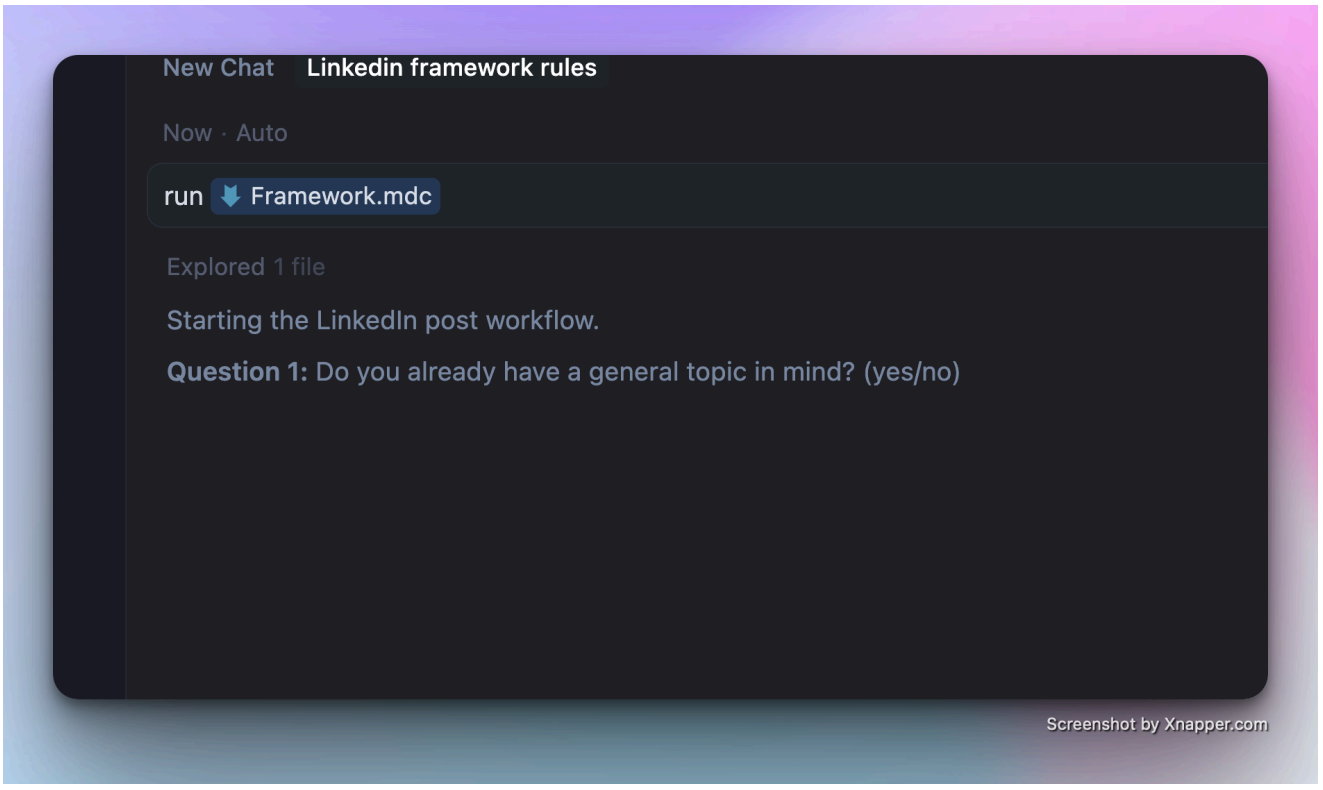


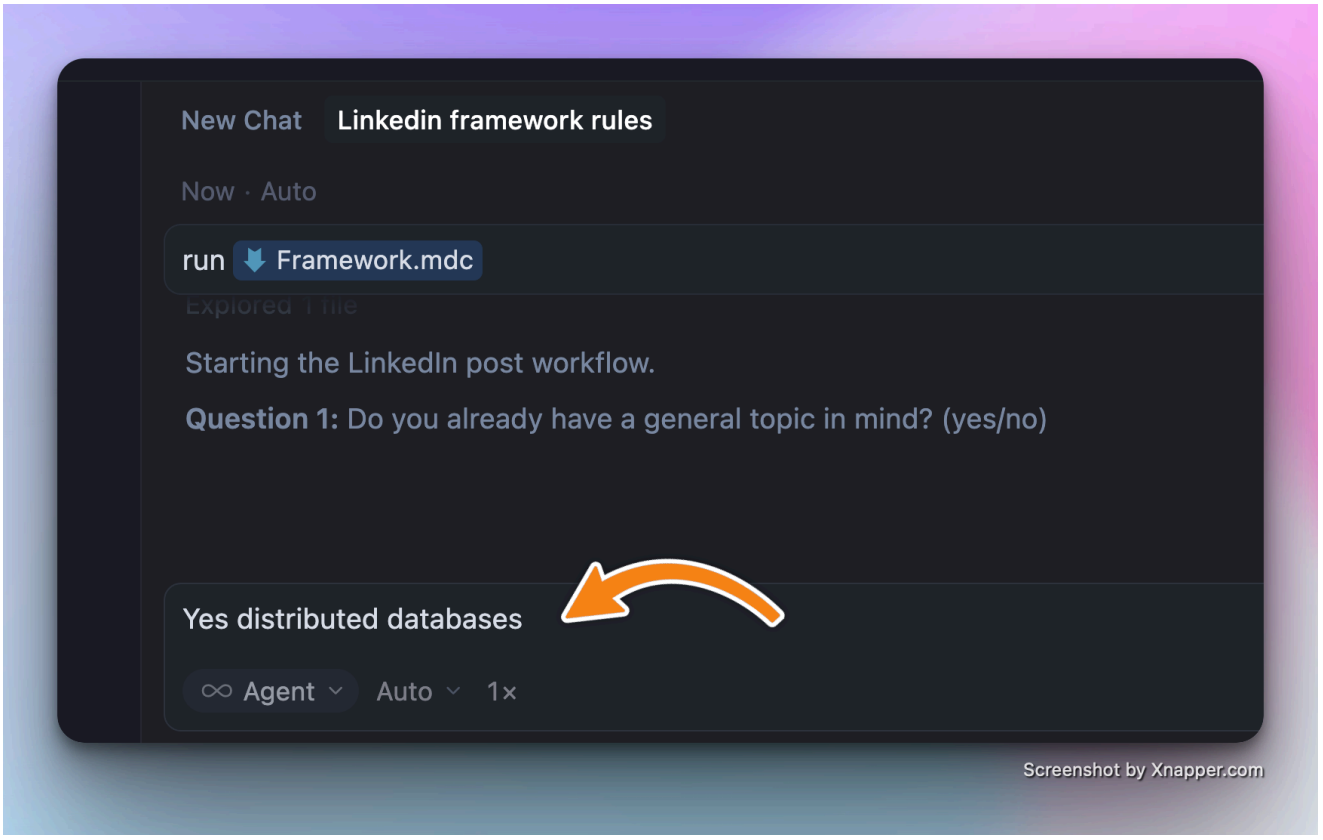
That's it.

Now prompt `run @framework`

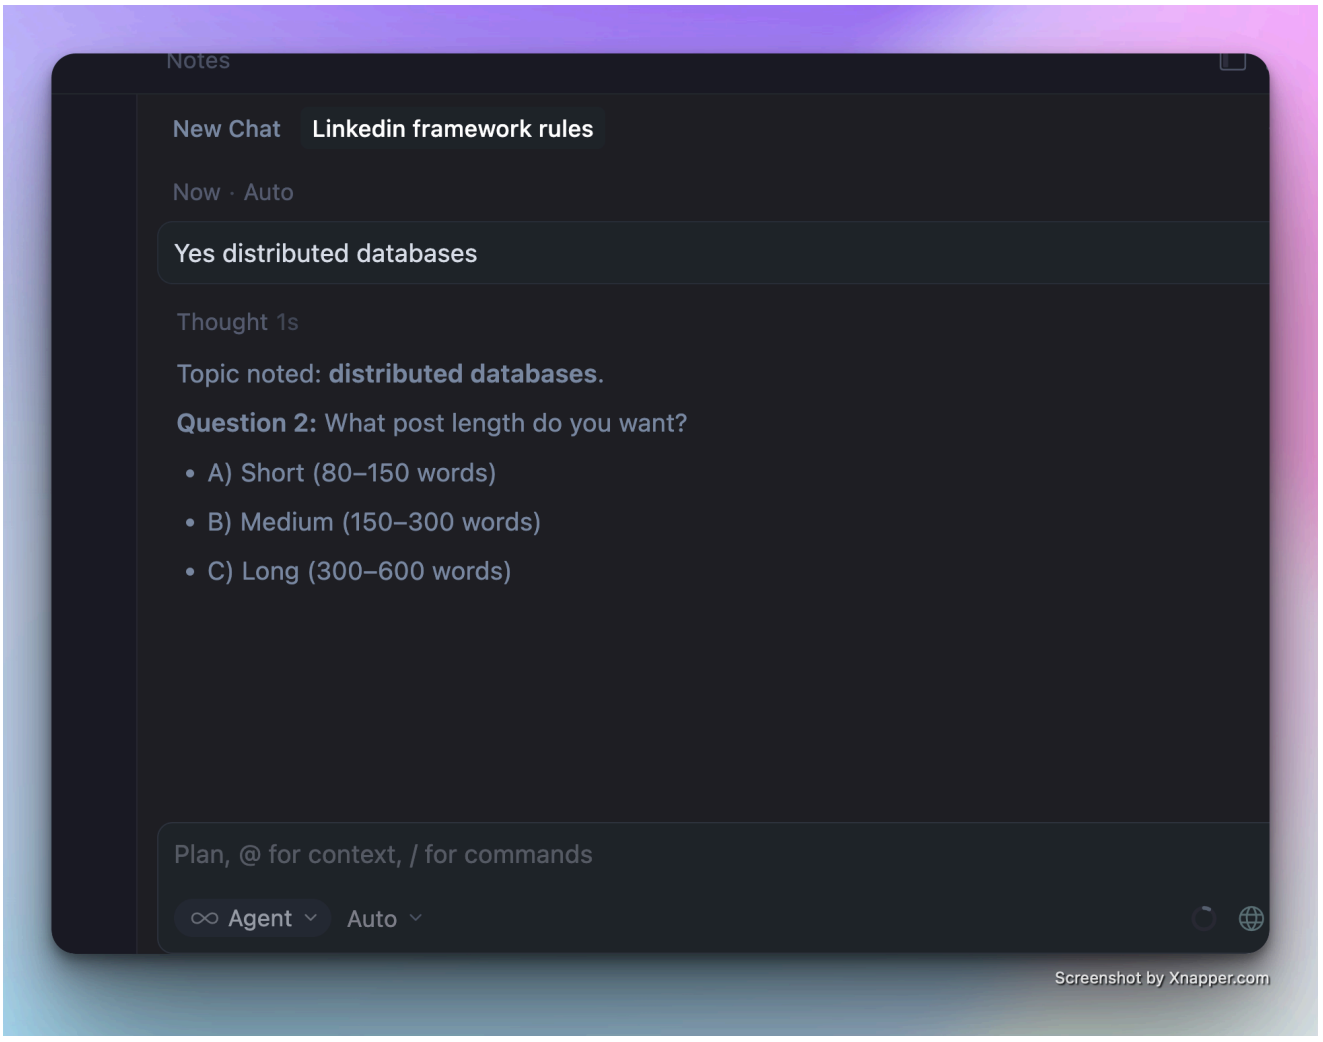


And follow the steps.





Just keep answering the questions ..



Conclusion

This workflow is designed to remove all the friction in creating a new post and hence minimising the chance of skipping days and weeks.

If you do not use cursor there are way to set the rules in vscode, claude and gemini.

It will also work if you work with ChatGPT UI but you have to copy/paste the framework file each time.

Pros

- From thought to final post takes very little time.
- Low effort, which means hard to skip.
- Still uses your writing style which is good for authenticity.

Cons

- Content is generated from an initial idea not 100% written.
- Could be thought of as AI assisted.
- Removes the craft of writing something.
